No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The specification describes soluble recombinant proteins that comprise at least a dimer formed from the alpha and beta-chains of MHC (major histocompatibility complex) Class I and II molecules in which at least one chain has, attached to its C-terminus, at least part of the Fc region of an immunoglobulin. The recombinant proteins, when linked to an antigenied, pare used to count and/or purify antigen-reactive T lymphocytes and to characterize their phenotype, e.g. in preclinical evaluation of vaccines. They are also used as immunostimulants, count and determine phenotype of autoreactive T cells in subjects with, or at risk of developing, autoimmune diseases, e.g. for staging or count and determents, and (to purify and/or enrich Ag-reactive T cells from cell cultures or patient samples, for use in subsequent curative or preventative cellular therapy. The present sequence encodes a recombinant protein of the invention, comprising a beta chain of MHC molecules

                                                                                                                                                                                                                                                                                                                     ઠ
                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a hybrid IA beta chain gene, containing the chicken ovalbumin peptide (COVA). This sequence was used in the construction of a hybrid IA alpha beta dimer. The encoded protein (plAd-OVA) was found to be more stable than the IA alpha beta dimer. The stability was decreased by the addition of a MHC groove specific binding peptide (e.g. see AAR82527, AAR82528 and AAR82511), compared to an increase seen on the addition of a MHC binding peptide to IE k/d-MCC. These complexes may be used to regulate an immune response. The complexes are capable of being recognised by a TCR alone or in combination with additional MHC proteins. These complexes are useful for therapeutic purposes and experimental purposes. They can also be used as reagents for the treatment of diseases including autoimmune diseases, immunodeficiency diseases, immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      300

acid sequence comprising one or more deletions, substitutions or additions. The molecule of the invention may be useful for detecting an antigen-specific CD4+ T-cell by flow cytometry and for presenting an microorganism-derived mucous membrane invasive protein as an antigen. The method of the invention enables efficient detection of antigen-specific activation of CD4+ T-cells in the mucous membrane. The current sequence is that of the class II major histocompatibility complex-related I-Ab(alpha)-Cholera toxin B subunit (CTB)-leucine zipper (LZ)-BirA fusion
                                                                                                                                                                                                                                                                                                                                                                                              282

                                                                                                                                                                                                                                                                                                                       This sequence represents a hybrid IA beta chain gene. This sequence contains a fragment of the IE alpha chain (residues 56-73), as well as a linker and cleavage site. This sequence was transfected into a B cell line (M12.C3) using plasmid pM12-IAb-Ba. It was found that the encoded sequence was expressed in these cells. Complexes such as this may be used to regulate an immune response. The complexes are capable of being recognised by a TCR alone or in combination with additional MFC proteins. These complexes are useful for therapeutic purposes and experimental purposes. They can also be used as reasgents for the treatment of diseases including autoimmune diseases, immunodefliciency diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   299
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     419

The invention relates to a novel class II major histocompatibility complex (MHC) antigenic peptide composite comprising a peptide containing the T-cell antigenic determinant of a mucous membrane invasive protein and the extracellular region of a class II MHC molecule or at least part of the extracellular region of the class II MHC molecule having an amino acid sequence comprising one or more deletions, substitutions or additions. The molecule of the invention may be useful for detecting an antigen-specific CD4+ T-cell by flow cytometry and for presenting a microorganism-derived mucous membrane invasive protein as an antigen. The method of the invention enables efficient detection of antigen-specific activation of CD4+ T-cells in the mucous membrane. The current sequence is that of the class II major histocompatibility complex-related I-Ab(alpha)-Escherichia coli heat-labile toxin B subunit (LTB)-leucine
                                                                                                                                780
                                                                                                                                                                         Peptide-Class II major histocompatibility complex (MHC) composite, useful for detecting antigen specific CD4+ T-cell, comprises antigen peptide containing epitope of mucous membrane invasive protein, and extracellular region of MHC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /product= "I-Ab(beta)-Escherichia coli heat-labile toxin
B subunit (LTB)-leucine zipper (LZ)-BirA fusion protein"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 flow cytometry; mucous membrane invasive antigen;

heterologous leader peptide sequences and Kozak sequence for efficient expression of the fusion complex. Also included are inducing an immune response in a mammal against a targeted disorder, by administering bMA sequence comprising a fusion complex, or DNA sequence coding for a fusion complex which is a single chain fusion molecule) and suppressing an immune response in a mammal by administering to the mammal a DNA sequence comprising a transmembrane domain, and a full length MHC molecule that contains a transmembrane domain, and a presenting peptide that is a T cell receptor (TCR) antagonist or partial agonist and is covalently linked to the MHC protein, or DNA sequence coding for the fusion complex which is a single chain fusion molecule. The methods are useful for identifying a peptide that can modulate the activity of T cells, inducing an immune response in a mammal against a targeted disorder; and for suppressing an immune response in a mammal against a targeted disorder; and in sequence cuch as multiple sclerosis, insulin-dependent diabetes mellitus, then transment allowed as mouse MHC class II I-Ad fusion complex of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       300

The invention relates to a major histocompatibility complex (MHC) fusion complex (I) comprising an MHC molecule that contains a peptide-binding groove, and a presenting peptide covalently (e.g. an antigenic peptide). Inked to the MHC molecule, where (I) is capable of modulating the complex, where the MHC molecule is a class II MHC (e.g. mouse I-Ad or I-Ag, or human HLA-DRI (human leukocyte antigen-DRI)), a multivalent MHC tusion complex comprising two or more linked complexes, identifying a peptide that can modulate the activity of T cells (involving introducing into host cells cloning vectors that each contain the fusion ocmplex DNA, culturing the host cells under conditions suitable for expression of the MHC fusion complex, and selecting host cells that express MHC fusion complex, and selecting host cells that and beta chains complex that modulate the activity of T cells), a single recombinant expression vector comprising DNA that codes for the alpha and beta chains of the fusion complex MHC protein, a single recombinant expression vector comprising DNA that codes for a T cell costimulatory factor and the alpha

Novel major histocompatibility complex fusion complex having presenting peptide covalently linked to MHC molecule containing peptide-binding groove, used for suppressing immune response in multiple sclerosis, allergies

Fig 27; 126pp; English. Example 17;

The invention relates to a major histocompatibility complex (WHC) fusion complex (I) comprising an MHC molecule that contains a peptide-binding proces, and a presenting peptide covalently (e.g. an antigenic peptide) linked to the MHC molecule, where (I) is capable of modulating the activity of a Tcell. Also included are a DNA construct coding for the complex, where the MHC molecule is a class II MHC (e.g. mouse I-Ad or I-As) or human HLA-DR1 (human leukocyte antigen-DR1), a multivalent MHC (fusion complex comprising two or more linked complexes, identifying a peptide that can modulate the activity of T cells (involving introducing into host cells ender conditions using the fost complex and selecting host cells that express MHC fusion complex hat modulate the activity of T cells (involving introducing into host cells ender conditions using be recombinant expression of the complex that modulate the activity of T cells (involving introducing into host complex that modulate the activity of T cells (involving introducing complex that modulate the activity of T cells (involving introducing complex that modulate the activity of T cells (involving introducing complex that modulate the activity of T cells (involving introducing complex that complex MHC protein, a single recombinant expression vector comprising DNA that codes for a T cell costimulatory factor and the alpha and beta chains of the MHC fusion complex. Also included are inducing an immune response in a mammal (including vaccinating a mammal apainst a targeted disorder, by administering DNA sequence comprising a fusion complex, or DNA sequence coding for a fusion complex which is a single chain fusion modulate the agonist and is covalently linked to the MHC protein, or DNA sequence contains a T cell receptor (TCR) antagonist or partial agonist and is covalently linked to the MHC protein, or DNA sequence coding for the fusion complex which is a single chain (including an animal including a peptide chain for including a perinder that can mammal a planting a pep immune response in a mammal. The disorders include an autoimmune disorder such as multiple sclerosis, insulin-dependent diabetes mellitus, rheumatoid arthritis, myasthenia gravis or chronic allergies. The present sequence encodes a mouse MHC class II I-Ad fusion complex of the

complex (sc-MHC) class II complexes that comprise a peptide binding complex (sc-MHC) class II complexes that comprise a peptide binding groove, and a modified class II beta 2 chain or covalently linked crowled class II beta 2 chain or covalently linked complexes immunoglobulin (Ig) light chain constant (CI) region. The MHC complexes are useful for detection and analysis of peptide ligands, pathogenic T cells, for functional, cellular and molecular assays. They can be used to identify and isolate T cell receptor and/or MHC agonists and antagonists. They can be used in vivo to compete with pathogenic antigen presenting cells involved in immune-related disorders. They can also be used to comprishing modified class II beta 2 chains and/or 19-CI regions are soluble and provide enhanced yield. These MHC complexes also can contain single antigenic peptides readily isolated from expressing cells in single cans to detect cells expressing multiple target structures with a single complexe. The present sequence represents a DNA encoding a single chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 AGCAGCCCCGGGACTGAGGGCGGAAACTCCATCTGCTTCTCGCCGTCGCTGGAGCACCCG 120

```
CC complex (I) comprising an WHC molecule that contains a peptide-binding CC groove, and a presenting peptide covalently (e.g. an antiganic peptide) current and a presenting peptide covalently (e.g. an antiganic peptide) correctly activity of a T cell. Also included are a DNA construct coding for the activity of a T cell. Also included are a DNA construct coding for the CC complex, where the MHC molecule is a class IN MHC (e.g. mouse I-Ad or I-As, or human HLA-DR1 (human laukocyte antigan-DN1), a multivalent MHC tusion complex comprising two or more linked complexes, identifying a cc clusting the host cells cloning vectors that each contain the fusion complex and selecting host cells that expression of the CMHC fusion complex, and selecting host cells that expression of the CMHC fusion complex, and selecting host cells that expression vector complex that modulate the activity of T cells, a single recombinant complex that modulate the activity of T cells, a single recombinant complex that codes for a T cell costimulatory factor and beta chains of the MHC fusion complex. The DNA constructs can contain complex that codes for a T cell costimulatory factor and the alpha and beta chains of the MHC fusion complex. Also included are inducing an immune cresponse in a mammal (including vaccinating a mammal against a targeted disorder, by administering by administering an expression of the fusion complex which is a single chain that on the molecule) and suppressing an immune response in a mammal a DNA sequence comprising an expression vector, encoding a cut mammal a DNA sequence comprising an expression of DNA sequence comprising an expression of the fusion complex which is a single chain to DNA sequence comprising an expression of DNA sequence comprising an expression of DNA sequence comprising a mammal and is a mammal and is contained by a mammal and sequence comprising a peptide that contained an expression of DNA sequence coding for the fusion complex which is a slingle chain to an amount of a mammal against a targete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 AGCAGCCCCGGGACTGAGGGCGGAAACTCCATCTGCTTCTCGCCGTCGCTGGAGCACCCG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
```

The invention relates to a major histocompatibility complex (MHC) fusion

Example 17; Fig 28; 126pp; English.

allergies

Novel major histocompatibility complex fusion complex having presenting peptide covalently linked to MHC molecule containing peptide-binding groove, used for suppressing immune response in multiple sclerosis,

AAT17588 encodes a murine MHC fusion complex capable of modulating T cell
activity encoded by the vector SCEI. The MHC fusion complex comprises at
least one MHC molecule containing a peptide-binding groove and a
presenting peptide covalently linked to the MHC molecule and opt. a
creamment of the molecule covalently linked to the MHC molecule and opt. a
creamment of the molecule and opt. a
creamment of the molecule and opt. a
creamment of the express the complex. The transformed cells may then
complexed to identify peptides that modulate, pref. antegonise, T cell
activity. DNA encoding a MHC fusion complex or a single chain fusion
complexed may be used to vaccinate a mammal against a targeted disorder.
The fusion complexes may be used to suppress an immune response in an
animal suffering from an immune disorder e.g. multiple sclerosis, insulin
cdependent diabetes mellitus, rheumachoid arthritis, myasthenia gravis or
chronic allergies. The complexes may also be used in the treatment of
chronic allergies. The complexes may also be used in the treatment of
chronic allergies. The complexes may also be used in the treatment of
creation and acts and dogs. The MHC fusion complexes can be
produced such that they contain a single antigenic peptide including one
complexed for T cell interaction
complexed and personed and personed and personed for T cell interaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GGTGGAGGCTCCGAAAGGCATTTCGTGGTCCAGTTCAAGGGCGAGTGCTACTACACCAAC 240

AAT17586 encodes a murine MHC fusion complex capable of modulating T cell
activity encoded by the vector SSC1. The MHC fusion complex comprises at
least one MHC molecule containing a peptide-binding groove and a
presenting peptide covalently linked to the MHC molecule and opt. a
transmembrane domain. DNA encoding a MHC fusion complex may be cloned
into a host cell to express the complex. The transformed cells may then
ce transmembrane domain. DNA encoding a MHC fusion complex may be cloned
activity. DNA encoding a MHC fusion complex or a single chain fusion
conclecule may be used to vaccinate a mammal against a targeted disorder.
The fusion complexes may be used to suppress an immune response in an
animal suffering from an immune disorder e.g. multiple sclerosis, insulin
capendent diabetes mellitus, rheumatoid arthritis, myasthenia gravis or
chronic allergies. The complexes may also be used in the treatment of
through that they contain a single antigenic peptide including one
of known structure, additionally a wide range of peptides can be
controlled for T cell interaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 AGCAGCCCCGGGACTGAGGCCGGAAACTCCATCTGCTTCTCGCCGTCGCTGGAGCACCCG 120

AAT17587 encodes a murine MHC fusion complex capable of modulating T cell activity encoded by the vector SCT1. The MHC fusion complex comprises at least one MHC molecule containing a peptide-binding groove and a presenting peptide covalently linked to the MHC molecule and opt. a cramsmembrane domain. DNA encoding a MHC fusion complex may be cloned into a host cell to express the complex. The transformed cells may then complex or a single chain fusion activity. DNA encoding a MHC fusion complex or a single chain fusion activity. DNA encoding a MHC fusion complex or a single chain fusion complexes may be used to suppress an immune response in an animal suffering from an immune disorder e.g. multiple sclerosis, insulin chaptened mailitus, rheumatoid arthritis, myasthenia gravis or chronic allergies. The complexes may also be used in the treatment of compound such as casts and dogs. The MHC fusion complexes can be confouced such that they contain a single antigenic peptide including one of known structure, additionally a wide range of peptides can be complexed for T cell interaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ä

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                              The specification describes soluble recombinant proteins that comprise at least a dimer formed from the alpha and beta-chains of MHC (major histocompatibility complex) Class I and II molecules in which at least one chain has, attached to its C-terminus, at least part of the Fc region of an immunoglobulin. The recombinant proteins, when linked to an antigenic peptide, are used to count and/or purify antigen-reactive T lymphocytes and to characterize their phenotype, e.g. in preclinical evaluation of vaccines They are also used as immunostimulants, particularly for vaccine development (against infections and tumours), to count and determine phenotype of autoreactive T cells in subjects with, or at risk of developing, autolimune diseases, e.g. for staging or evaluating treatments, and (to purify and/or enrich Ag-reactive T cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 140
                                                                                                                                                                                                                                                                                                                                             from cell cultures or patient samples, for use in subsequent curative or preventative cellular therapy. The present sequence encodes a recombinant protein of the invention, comprising a beta chain of MHC molecules

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a hybrid IA beta chain gene, containing the chicken ovalbumin peptide (cOVA). This sequence was used in the construction of a hybrid IA alpha beta dimer. The encoded protein (pIAd-OVA) was found to be more stable than the IA alpha beta dimer. The stability was decreased by the addition of a MHC groove specific binding peptide (e.g. see ARR82527), ARR82528 and ARR82511, compared to an increase seen on the addition of a MHC binding peptide to IE k/d-MCC. These complexes may be used to regulate an immune response. The complexes are capable of being recognised by a TCR alone or in combination with additional MHC proteins. These complexes are useful for therapeutic purposes and experimental purposes. They can also be used as reagents the treatment of diseases including autoimmune diseases, immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        168
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide-MHC complex comprising antigenic peptide, linker and MHC segment - useful as reagents for the treatment of diseases including auto-immune diseases, immuno-stimulatory diseases or graft-host rejection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                The invention relates to a novel class II major histocompatibility complex (MHC) antiganic peptide composite comprising a peptide containing the T-cell antiganic determinant of a mucous membrane invasive procein and the extracellular region of a class II MHC molecule or at least part of the extracellular region of the class II MHC molecule having an amino acid sequence comprising one or more deletions, substitutions or microsorganism-derived mivention may be useful for detecting an anticon-specific CD4+ T-cell by flow cytometry and for presenting a microorganism-derived mucous membrane invasive protein as an antigen. The method of the invention nables efficient detection of antigen-specific activation of CD4+ T-cells in the mucous membrane. The current sequence is that of the class II major histocompatibility complex-related I-cbNA (Alphah)-ChOlecra toxin B subunit (CTB)-leucine zipper (LZ)-BirA fusion compat the invention.
                                                                                                                 Peptide-Class II major histocompatibility complex (MHC) composite, useful for detecting antigen specific CD4+ T-cell, comprises antigen peptide containing epitope of mucous membrane invasive protein, and extracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     159

This nucleotide sequence comprises a PCR product obtained by amplification of mouse splencoyte cDNA using primers (see AAV12065 and AAV12066) designed for the amplification of IAd beta chain full-length cDNA. IAd alpha chain cDNA (see AAV12067) has been similarly obtained. The IAd sequences were cloned into metallothionein promoter (see AAV12062)-driven vector pRmHa-3 prior to sequencing. Major histocompatibility complex (MHC) class II IAd heterodimers were expressed at the cell surface of transfected Drosophila Schneider 2 (ATCC CRL 10974) cells. The invention relates to the preparation and use of synthetic antigen presenting matrices, in particular antigen presenting cells such as insect cells that have been transfected to produce MHC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Major histocompatibility class II antigen; MHC class II; T cell; T lymphocyte; Th1; Th2; activation; CD4+; antigen presenting cell; APC; autoimmune disease; diabetes; multiple sclerosis; autoimmune thyroiditis; systemic lupus erythromatosus; myasthenia gravis; Crohn's disease; inflammatory bowel disease; allergy; asthma; contact sensitivity; immunotherapy; therapy; IAd beta chain; mouse; ds; circular; cyclic.

                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                               8
                                                           The invention relates to a novel class II major histocompatibility complex (MHC) antigenic epetide composite comprising a peptide containing the T-cell antigenic determinant of a mucous membrane invasive protein and the extracellular region of a class II MHC molecule or at least part of the extracellular region of the class II MHC molecule having an amino acid sequence comprising one or more deletions, substitutions or additions. The molecule of the invention may be useful for detecting an antigen-specific CD4+ T-cell by flow cytometry and for presenting a microorganism-derived mucous membrane invasive protein as an antigen-specific activation of CD4+ T-cells in the mucous membrane. The current sequence activation of the class II major histocompatibility complex-related I-the label a coli hear-labile toxin B subunit (LTB)-leucine zipper (LZ)-BirA fusion cDNA of the invention.
